

Name: Abdul Wasay

1. Accounts Payable Invoice Processing

- **Process Name:** Accounts Payable Invoice Processing and Matching
- **Current Manual Process:** Accounts payable staff receive vendor invoices via email attachments or postal mail. They manually type invoice details into accounting software, visually cross-reference the invoice against purchase orders and receiving logs, email department managers for approval, and schedule payment dates.
- **Problem:** Manual data entry causes typos and duplicate payments. Approval requests sit unread in email inboxes, leading to missed early payment discounts, late penalties, and vendor friction.
- **Trigger:** Receipt of a vendor invoice via email, portal, or physical mail.
- **Input:** Vendor invoice (PDF or paper image), Purchase Order (PO) record, Goods Received Note (GRN).
- **Processing Required:**
 - Extract text, invoice numbers, and line items using Optical Character Recognition (OCR).
 - Perform a three way match comparing invoice line items against PO quantities and GRN pricing.
 - Route unmatched invoices or price discrepancies to the designated buyer for exception review.
 - Automatically route matched invoices to the department head for one click approval.
 - Create the payment voucher directly in the ERP system.
- **Expected Output:** Verified payment voucher posted in the accounting ledger, scheduled electronic payment, and audit trail record.
- **Benefits of Automation:**
 - Cuts processing time from weeks to minutes.
 - Eliminates duplicate payments and data entry errors.
 - Captures early payment discounts and avoids late fees.

2. Employee Onboarding and IT Provisioning

- **Process Name:** Employee Onboarding and Account Provisioning
- **Current Manual Process:** HR collects new hire documents via email, enters personal information into the HR Information System (HRIS), and emails IT a checklist for needed equipment and software. IT personnel manually create user accounts across multiple software tools.
- **Problem:** Manual setups leave new employees waiting days for software access, reducing first week productivity. Human oversight can also leave security gaps by assigning incorrect permission levels.
- **Trigger:** Candidate accepts an offer letter in the applicant tracking system.
- **Input:** Signed offer letter, new hire profile details, job title, department, manager name.

- **Processing Required:**
 - Sync new hire records automatically from the applicant tracking system into the HRIS.
 - Create corporate email addresses and central identity credentials.
 - Provision role-based access across required platforms (such as communication tools, project managers, and CRM systems).
 - Dispatch a automated welcome email with login instructions and first day schedule.
 - Send hardware fulfillment tickets to logistics.
- **Expected Output:** Active user accounts, provisioned software licenses, welcome onboarding packet sent, and hardware tracking ticket.
- **Benefits of Automation:**
 - Guarantees full system access on the employee's first day.
 - Reduces HR and IT administrative workload by up to 80 percent.
 - Standardizes role-based access control and security compliance.

3. Employee Expense Report Auditing

- **Process Name:** Employee Expense Audit and Reimbursement
- **Current Manual Process:** Employees fill out spreadsheet templates, attach receipt photos, and email them to managers. Managers review receipts item by item, approve via email, and forward to finance. Finance audits receipts against policy rules before initiating bank transfers.
- **Problem:** Reviewing receipts line by line is slow and prone to oversight. Employees experience delayed reimbursements, and policy violations go undetected due to manual review fatigue.
- **Trigger:** Employee submits a new expense claim through the expense portal or mobile app.
- **Input:** Receipt images, expense line items (amount, date, merchant, expense category), corporate travel policy rules.
- **Processing Required:**
 - Extract receipt metadata (merchant, date, total, tax) using receipt parsing technology.
 - Cross-check receipt information against submitted claim data to flag mismatched totals.
 - Evaluate expense lines against corporate policy rules (such as daily meal allowances or non-reimbursable categories).
 - Automatically approve compliant expenses under a specified dollar threshold.
 - Route non-compliant claims or high value expenses to department managers with highlighted flags.
 - Push approved reimbursement batches directly to accounts payable or payroll.
- **Expected Output:** Approved reimbursement batch file, automated status updates to the employee, and audit logs.
- **Benefits of Automation:**
 - Accelerates employee reimbursement turnaround from weeks to days.
 - Identifies policy violations and duplicate receipt submissions instantly.
 - Minimizes time finance teams spend reviewing routine receipts.

4. Customer Support Ticket Triage and Routing

- **Process Name:** Customer Support Ticket Triage and Assignment
- **Current Manual Process:** Support managers monitor a master inbox or unassigned queue, read incoming customer messages, evaluate urgency and topic, and manually assign each ticket to an available agent.
- **Problem:** Ticket assignment slows down during high volume periods or off-peak hours. Misrouted tickets get passed between agents repeatedly, increasing response times and frustrating customers.
- **Trigger:** Customer submits a support inquiry via web form, email, or live chat.
- **Input:** Customer message body, customer tier or account status, historical interaction records.
- **Processing Required:**
 - Analyze message text using natural language processing to identify intent, sentiment, and urgency level.
 - Classify the ticket category (such as billing issue, technical bug, or account access).
 - Evaluate agent skills, spoken languages, account assignments, and real-time workload.
 - Route the ticket directly to the best-suited agent or send instant self-service solutions for routine queries.
 - Escalate high tier customers or urgent negative sentiment tickets to team leads immediately.
- **Expected Output:** Categorized, prioritized, and assigned support ticket complete with customer context for the agent.
- **Benefits of Automation:**
 - Reduces initial response times from hours to seconds.
 - Prevents ticket bouncing between internal teams.
 - Ensures even workload distribution across support teams.

5. Vendor Contract Renewal Management

- **Process Name:** Vendor Purchase Order and Contract Renewal Management
- **Current Manual Process:** Procurement maintains contract expiration dates in static spreadsheets. Procurement officers manually email business owners when dates approach, circulating renewal terms and purchase orders over email for signatures.
- **Problem:** Static tracking leads to missed cancellation windows, causing unintentional auto-renewals for unused services. Unstructured email approvals create security risks and leave poor audit trails.
- **Trigger:** System alert triggered 90, 60, or 30 days prior to contract expiration date, or a new purchase order request submitted by a user.
- **Input:** Contract metadata (expiration date, cancellation notice period, vendor contact, annual value), purchase request details.
- **Processing Required:**
 - Scan contract repository continuously for upcoming renewal deadlines.
 - Generate renewal notification tasks and send usage analytics to the contract owner.

- Compare purchase request dollar amounts against corporate authorization tiers.
- Route requests through sequential approval workflows for digital signatures.
- Sync approved purchase orders into accounting systems automatically.
- **Expected Output:** Timely contract renewal decisions, digitally signed vendor agreements, and active purchase orders.
- **Benefits of Automation:**
 - Prevents unwanted auto-renewals and eliminates redundant software spend.
 - Delivers complete corporate visibility into upcoming vendor obligations.
 - Enforces compliance with internal financial delegation thresholds.
